

Fleet-wide analysis of 2,736 voyages across 4 ship types, 4 route types, and 3 weather conditions
June 2023 - June 2024.

Rough weather reduces fleet efficiency by 3.6% compared to calm conditions. Counterintuitively, vessels with Critical maintenance status show slightly higher efficiency than Good status vessels — suggesting maintenance labels may reflect scheduled classification rather than real-time condition.

Long-haul routes generate the highest average profit per voyage (\$273K) despite carrying the highest operational costs — driven by stronger revenue (\$530K avg). Transoceanic routes show the lowest profit margin despite similar costs.
